                                                                                                                                                                                                                                                                                                           IMPORTANT: This sequence is NOT necessarily the entire insert of clone T23D8. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

The true 16ft end of clone T23D8 is at 1 in this sequence. The true 16ft end of clone T23D8 is at 1 in this sequence. The true 16ft end of clone T24D8 is at 1249 in this sequence. The true right end of clone T24D1 is at 12749 in this sequence. Coding sequences below are predicted from computer analysis, and other available information.

The start of this sequence (1..104) overlaps with the end of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /organism="Caenorhabditis elegans"

B 94150718

Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is NOT necessarily the entire insert of clone T23D8. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

The true left end of clone T23D8 is at 1 in this sequence. The true right end of clone T23D8 is at 34576 in this sequence. The true right end of clone T24D1 is at 12749 in this sequence. Coding sequences below are predicted from computer analysis, using the program Genefinder (P. Green, ms in preparation), and other the start of this sequence (1..104) overlaps with the end of sequence (EET241).
                                                                       C (bases I to 34576)

It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

The true left end of clone T23D8 is at 1 in this sequence. The true right end of clone T23D8 is at 15749 in this sequence. The true right end of clone T24D1 is at 12749 in this sequence. Coding sequences below are predicted from computer analysis, using the available information.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ALVYFFFTPIVVSLALGAVLLVCGIWSMIRIRSYIKLQHADVERNISKLEKLMLRIGA

Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is NOT necessarily the entire insert of
         histone H4; Mouse bright protein like; transporter protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         complement(join(7258..7391,7494..7638,8798..8860,

3']; double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pp773 vector. RNA provided by Dr. Bertrand Jordan. Library went through three rounds of normalization, and was constructed by Clone="596372" /clone="596372" /clone="11b="Soares mouse 3NbMS"
                                                                                                                                                                                                                                                                                                                                                                                                                            :,

Mean 15.331; Variance 11.948; scale 1.283 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

P. T.	N-PSDB; Q10324. Natriuretic protein receptor B - for diagnosis and treatment of	6y	
PT PS	kidney failure, heart failure, hyperaldosteronism, glaucoma etc. Claim 3; Fig 1; 49pp; English.	qo	
ខ្ល	The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having quanyl cyclase (GC) activity and protein	ò	
ខ្លួ	kinase activity. The DNA can be inserted into expression vectors for the prodn. of the protein, opt. after being mutated to produce	୍ ପ	
ខ	NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr=	ė	
ខខខ	114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptided using affinity chromatography. Antibodies with affinity for NPRB can	δŏ	
ខម	also be prepd.	RESULT	ΗC

They are also easier to recover from incubation mixts. Sequence 501 BP; 111 A; 31 C; 68 G; 80 T;

Claim 28; Chart 21, page 43; 71pp, English. Compared with interferon beta prepd. by recombinant methods, the INFs of the invention are more active and have different affinities

New modified human beta interferon polypeptide(s) - prepd. by

P-PSDB; P50033

plasmid transformed bacteria, with improved antiviral, anti-proliferative and immune regulating actions

for cell surface receptors (allowing selective targetting); they

have higher therapeutic index; improved stability against microbial breakdown during synthesis; and better in vivo solubility and stability. They are also easier to recover from incubation mixts. Sequence  $498~\mathrm{Bp};~112~\mathrm{A};~30~\mathrm{C};~68~\mathrm{G};~77~\mathrm{T};$

Compared with interferon beta prepd. by recombinant methods, tho INFs of the invention are more active and have different affinities for cell surface receptors (allowing selective targetting); they INFs of the invention are more active and have different affinities have higher therapeutic index; improved stability against microbial stability. They are also easier to recover from incubation mixts. Sequence 501 BP; 107 A; 31 C; 69 G; 80 T; haaycayytbaaracngtnytbgargataarytbgaraargargayttyacnmgdggnaa 226 wnnacnggntggaaygaracnathgtngaraayytbytbgcnaaygtn-taycaycarat Sequence encoding new modified human beta interferon polypeptides Compared with interferon beta prepd. by recombinant methods, the for cell surface receptors (allowing selective targetting); they ;; breakdown during synthesis; and better in vivo solubility and δ New modified human beta interferon polypeptide(s) - prepd. Antiviral; cell growth regulator; immune system regulator; antiproliferative; ss. 95; Mismatches 167; Indels Score 51; DB 3; Length 501; Pred. Compared with interferon beta prepd. by recombinant methods, the INFs of the invention are more active and have different affinities for cell surface receptors (allowing selective targetting); they have higher therapeutic index; improved stability against microbial breakdown during synthesis; and better in vivo solubility and stability: They are also easier to recover from incubation mixts.   1; Gaps
  anti-proliferative and immune regulating actions Claim 28; Chart 2b, page 33; 71pp; English.

Compared with interferon beta prepd. by recombinant methods, the INFs of the invention are more active and have different affinities for eal surface receptors (allowing selective targetting); they have higher therapeutic index; improved stability against microbial breakdown during synthesis; and better in vivo solubility and stability. They are also easier to recover from incubation mixts. Sequence 501 BP; 110 A; 32 C; 66 G; 81 T;
   Sequence encoding new modified human beta interferon polypeptides
  New modified human beta interferón polypeptide(s) - prepd. by plasmid transformed bacteria, with improved antiviral,
